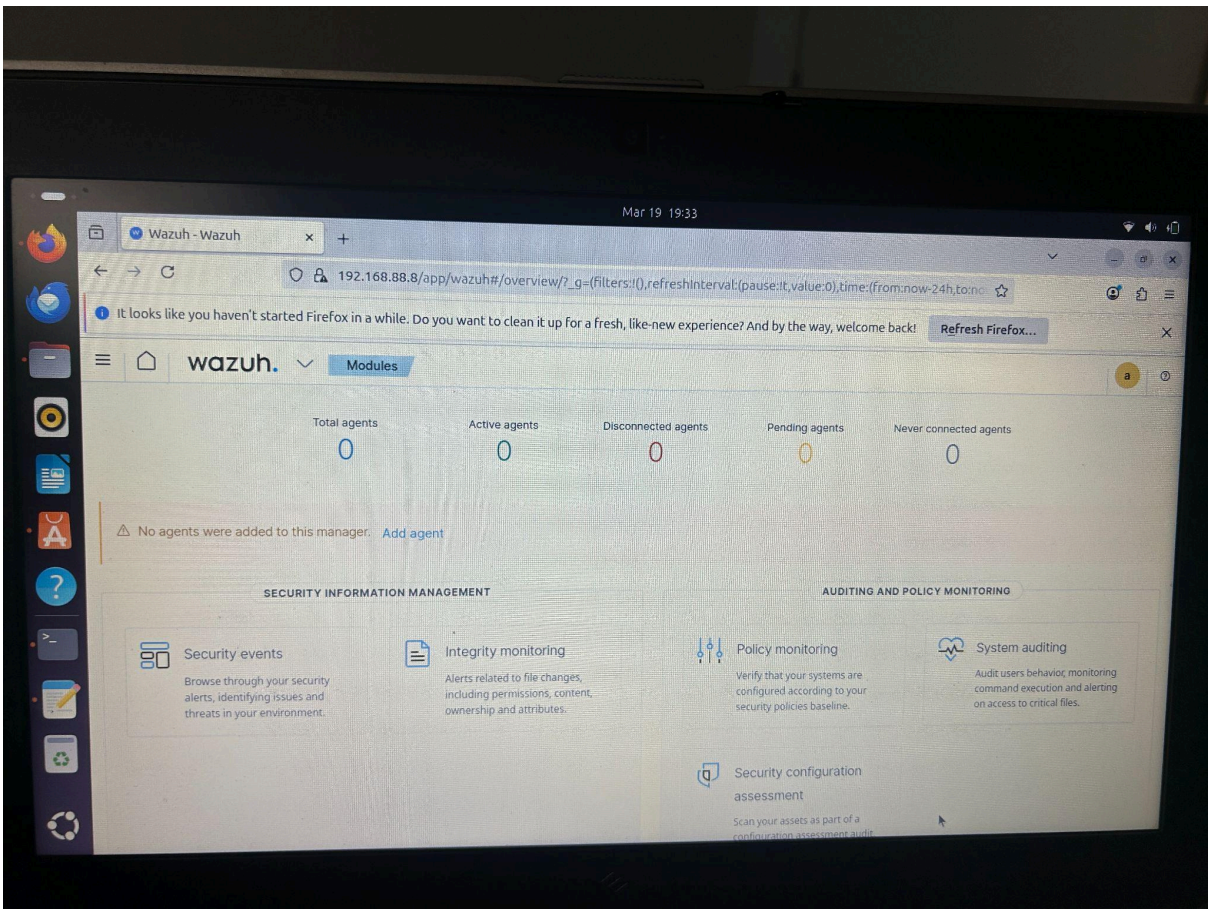
HOME SOC LAB EVIDENCE

Set up a 3-machine security monitoring lab using Wazuh, a free open source SIEM tool used by real companies. I configured one Ubuntu laptop as the central security server and connected two Windows laptops as monitored endpoints.

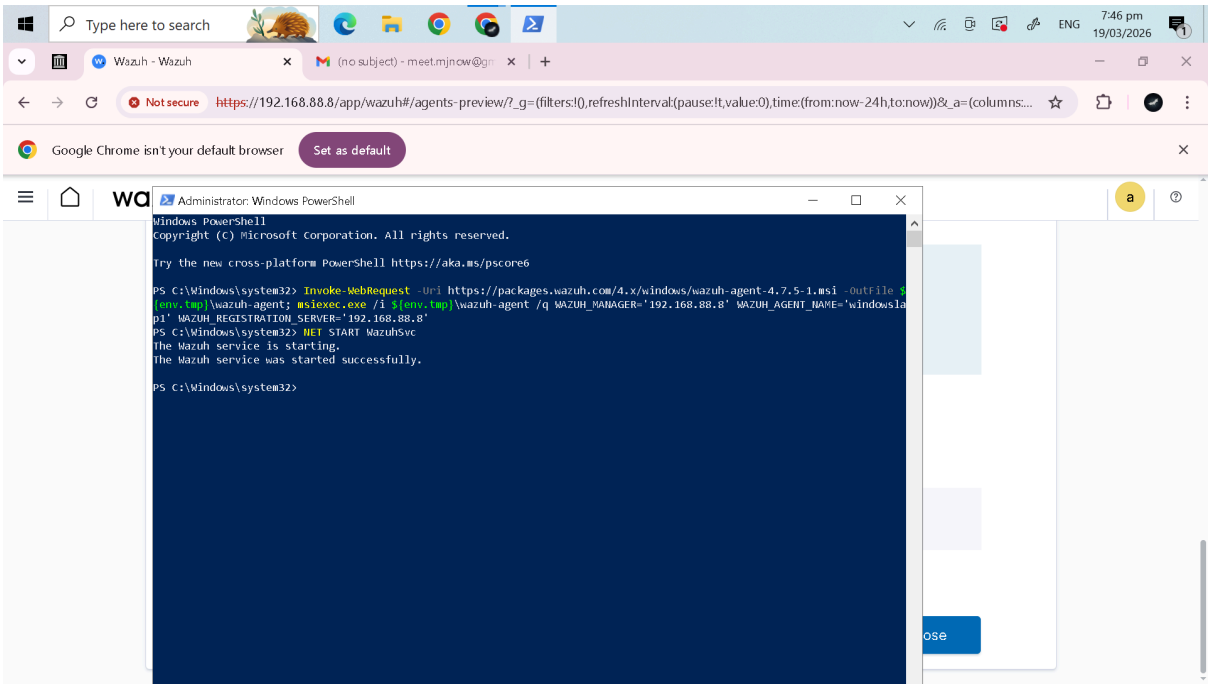
Machine	OS	Role	IP Address
Linux Laptop	Ubuntu	Wazuh Server	192.168.88.8
Windows Laptop 1	Windows	Monitored Endpoint	192.168.88.10
Windows Laptop 2	Windows	Monitored Endpoint	192.168.88.__

What I Did

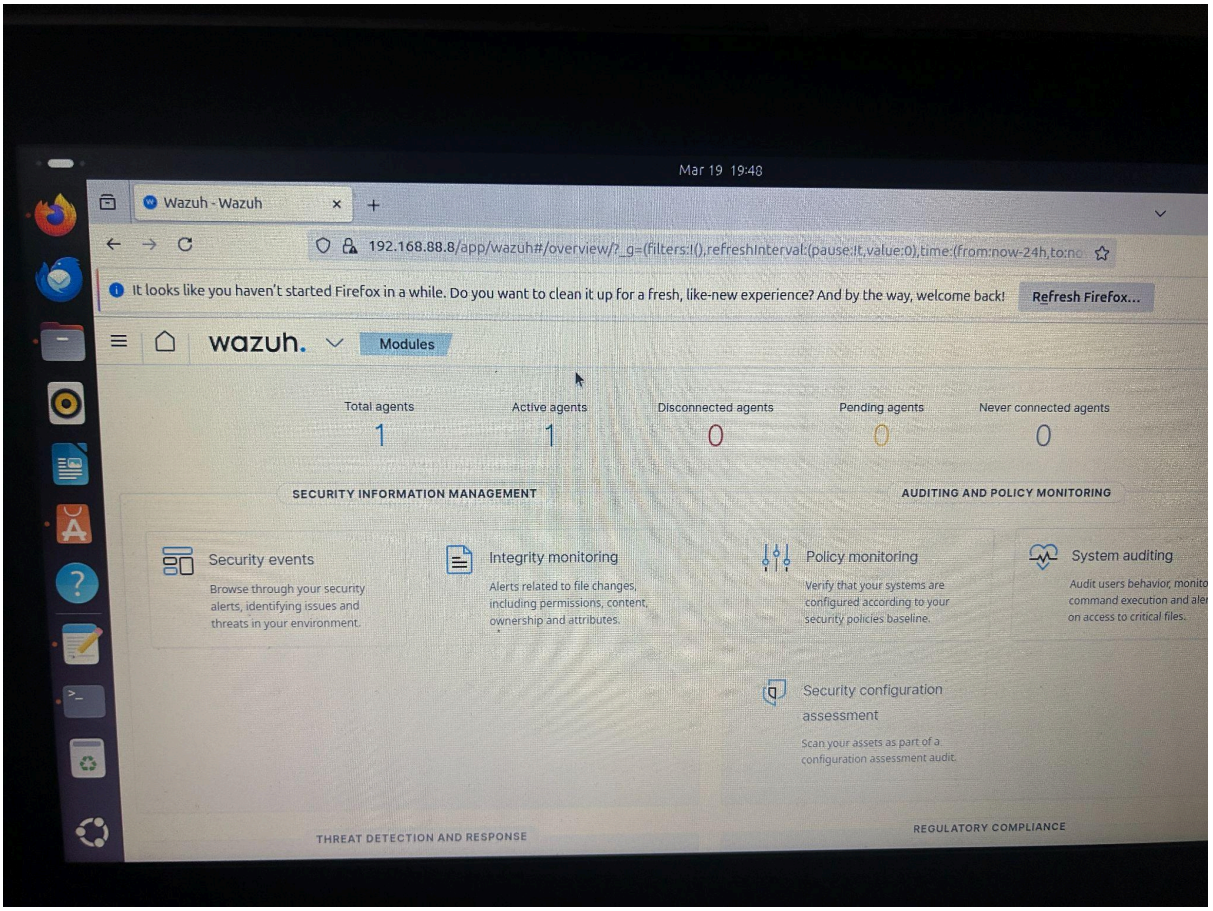
- Installed Wazuh SIEM server on Ubuntu laptop

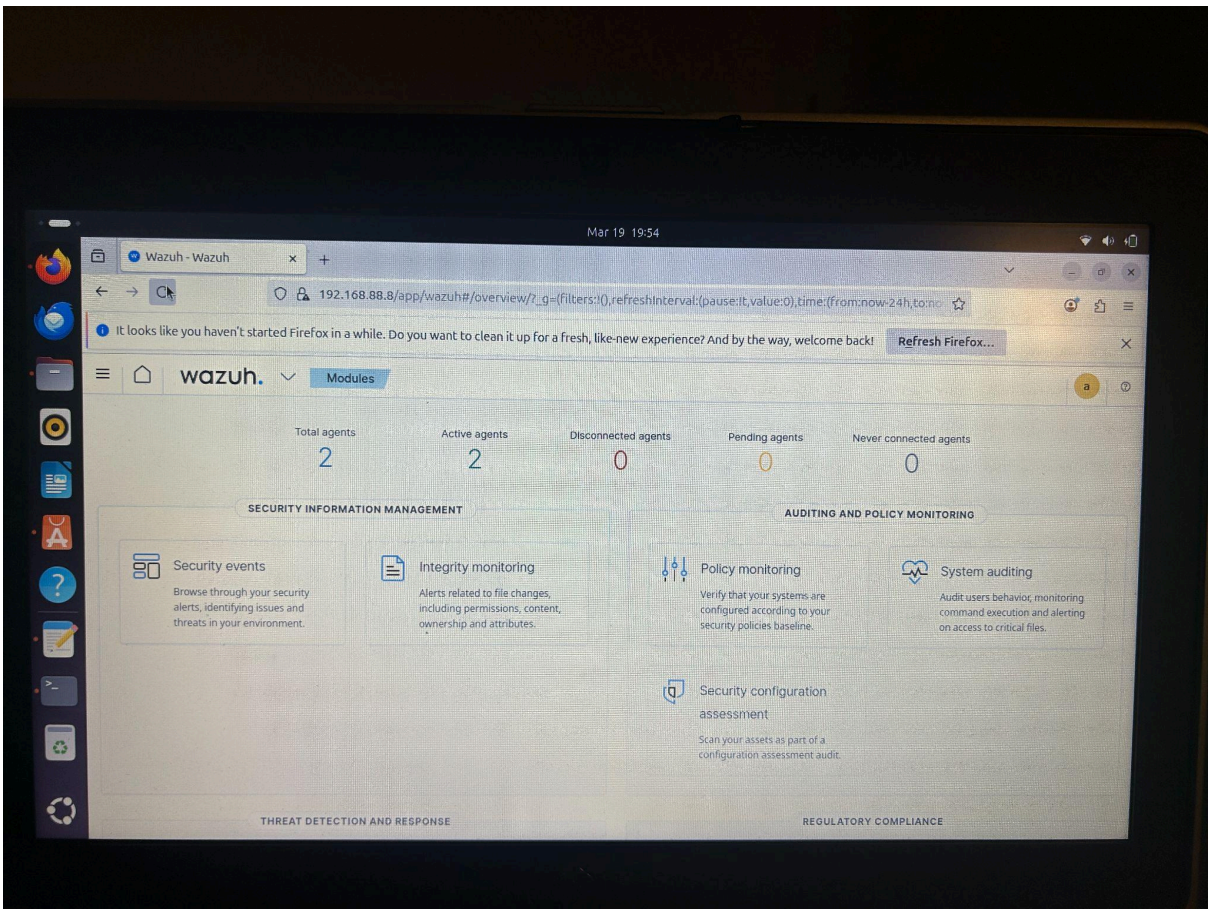


- Connected two Windows laptops as monitored agents

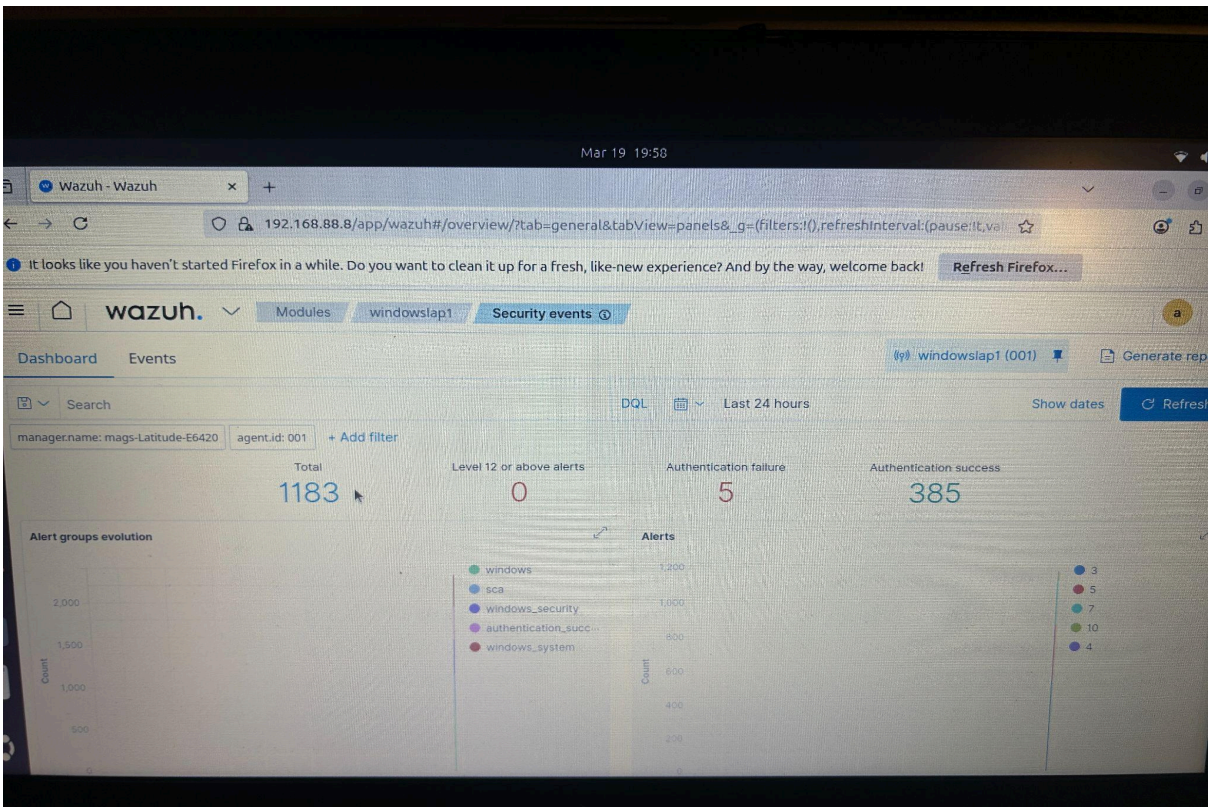


- Verified all agents connected and showed active status

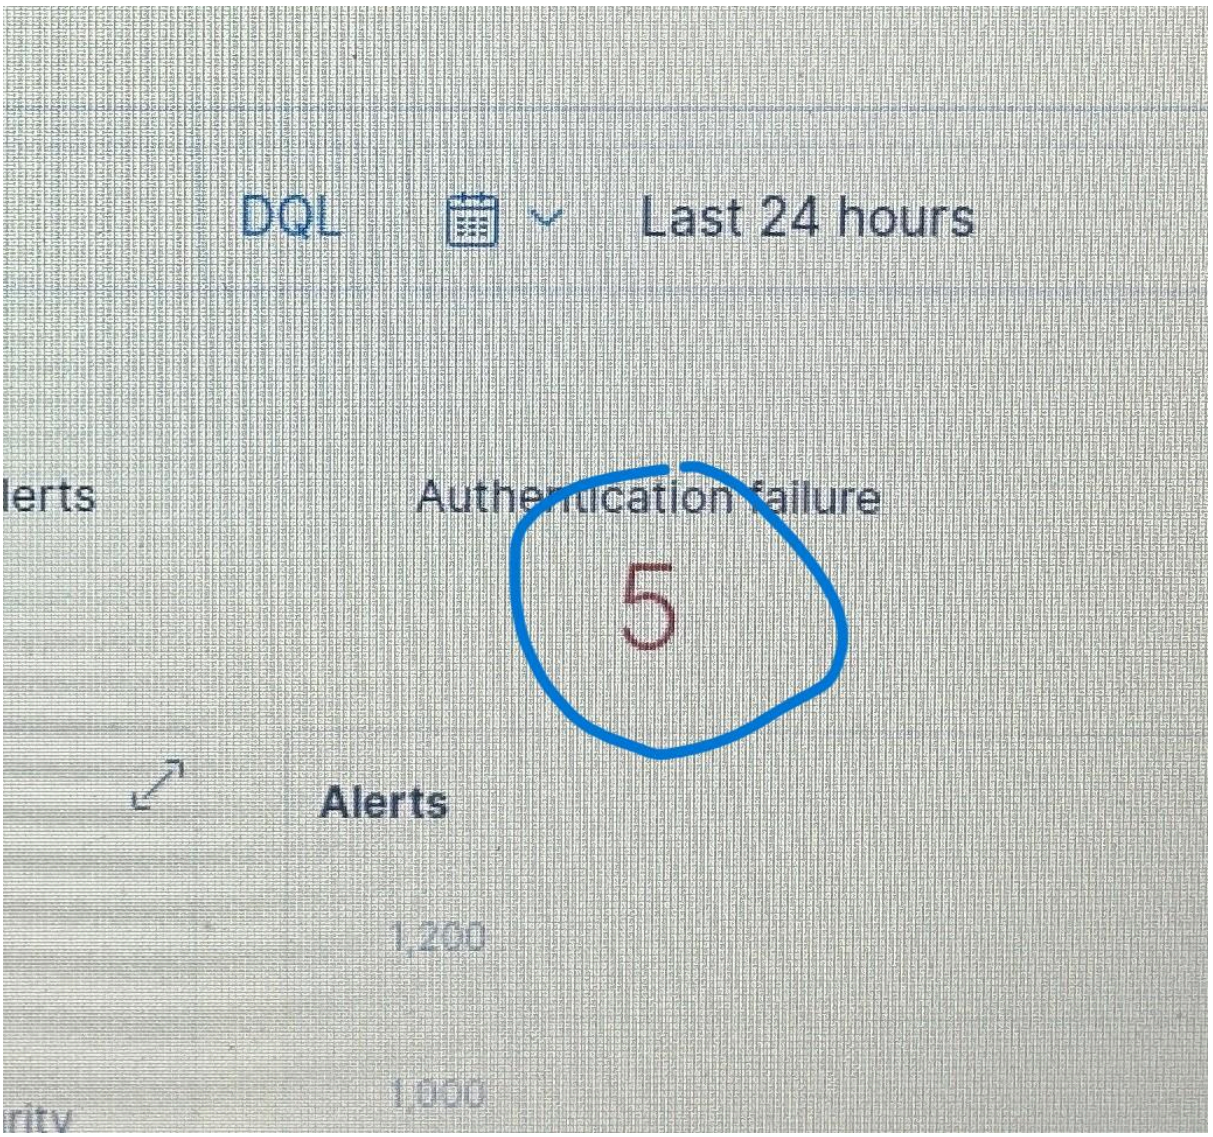




- Generated real security alerts by simulating 5 failed login attempts



- Monitored and documented live alerts in the Wazuh dashboard



Alerts Detected

- 5 authentication failure alerts from Windows Laptop 1

Tools Used Wazuh · Ubuntu 24.04 · Windows · nmap · Firefox

What I Learned This project taught me how SIEM tools collect and display security events from multiple machines at once. I learned how to deploy monitoring agents, generate real security alerts, and investigate events in a security dashboard — skills used daily by SOC analysts and IT helpdesk teams.
